I. Introduction

1. Over the past decade the Pan-African institutions, through APAI-CRVS, have played a critical role in advancing the uptake of both CRVS and, more recently, Digital Identity. During this period a substantial amount of policy and technical guidance has been prepared. Progress in the planning and implementation of systems has been tracked primarily through ad hoc qualitative narratives.
2. Quantitative metrics have been less forthcoming. The primary sources for these remain estimates of varying accuracy derived from household surveys and electoral registers. This was understandable when CRVS relied on paper registers but with the increasing uptake of digital systems this approach is no longer fit for purpose.
3. Systematic annual monitoring of countries' progress in their development of both CRVS and Digital Identity is now possible using metrics derived from the systems themselves. This paper proposes a simple governance and indicator framework that will make major improvements to the measuring of the state of CRVS and digital identity in Africa.

II. Unique ID at birth: Integrating CRVS and Digital Identity

4. There is an increasing consensus on the need to integrate CRVS with digital identity.
5. The Third Conference of African Ministers Responsible for Civil Registration held in February 2015 resolved to “establish solid linkages between civil registration and national identity systems in efforts to manage one legal identity and to improve governance and service delivery”¹
6. The Nouakchott Declaration of December 2017 encouraged African Union (AU) member states “to develop shared information and communication technology assets in support of effective civil registration and vital statistics systems for the continent, which are built to common standards and are interoperable with other governmental systems, such as health and identity management.”²
7. One of the expected outcomes of the Fifth Conference of African Ministers Responsible for Civil Registration in October 2019 is to reach an agreement “on the strategic direction for a comprehensive legal framework, adopting technological innovations, improving interoperability and strengthening institutional capacity and coordination across ministries and agencies for the integrated improvement of CRVS and identity management systems.”³
8. Many countries in Africa will face two challenges in implementing these improvements. Firstly ID is not mandatory for children, let alone newborns, in most countries. Secondly investing in digital data capture capacity for all registrars is no small undertaking.
9. A sustainable, accountable and timely monitoring framework that is governed by the implementing countries could play a constructive role in supporting APAI-CRVS and its members in surmounting these challenges.
10. While the ideal solution may be for a single system, many countries already maintain separate systems for vital events and legal identity. Whichever approach is adopted the core objectives are that an identity number is issued at the same time as a birth certificate and that data on both should be captured digitally at the point of registration. The methodology proposed in this paper is built on these fundamental objectives.

III. Review of current monitoring frameworks

CRVS

11. SDG Target 16.9 - “By 2030, provide legal identity for all, including birth registration” - is monitored by a UNICEF-maintained indicator that measures the “proportion of children under 5 years of age whose births have been registered with a civil authority, by age.”⁴
12. This is typically measured by a household survey. In the current Demographic and Health Survey questionnaire, the head of the household is asked, for every child aged 0-4, “Does (NAME) have a birth certificate? IF NO, PROBE: Has (NAME)'s birth ever been registered with the civil authority?”⁵ This method is deficient for many reasons. To name a few: Does the household head understand the difference between birth notification and birth registration? Is the birth certificate linked to a legal identity? Is the birth recorded in a national database or is the paper certificate the only lifetime proof of identity that the child has?
13. There are two global databases holding birth registration statistics, one maintained by UNICEF⁶ and one by the UN Statistics Division⁷. Appendix 1 contains a comparison of the two datasets for Africa.
14. The two datasets are substantially different and it is not clear which is the more authoritative. Over one third (35%) of countries have discrepancies between the two systems. Some of these are the result of different sources being used but a number have different values recorded despite coming from the same source.
15. Most countries have data sourced from DHS and MICS surveys, and it is notable that only 16 (30%) have data from 2015 or later.⁸

16. Beyond metrics, UNICEF maintains an invaluable qualitative database which contains a wealth of information on legal and policy frameworks, bureaucratic procedures and usage.⁹

⁷ <https://unstats.un.org/unsd/demographic-social/crvs/>

⁸ The chart uses the data in Appendix 1 and uses the most recent year of birth registration data recorded by either UNICEF or UNSD.

⁹ <https://data.unicef.org/crvs/>

Digital Identity

17. The World Bank Identification for Development Initiative¹⁰ maintains a wide ranging Global Dataset¹¹ on governance and processes. We learn, for example, that 51 African countries have some form of national ID. 45 of these have digital systems at various stages of development and 7 (Liberia, Libya, Mozambique, Rwanda, Seychelles, Sierra Leone and South Africa) are issuing IDs at birth. We also know that the vast majority of countries have a mandatory ID age of 16 or 18 and only 5 countries require ID below the age of 10.¹²
18. Its actual registration metrics, however are very limited. The database uses UNICEF 0-4 birth registration percentages to calculate the number of IDs issues below the mandatory ID age. Assuming that all children with a birth certificate are 'registered' in the sense of a legal identity is a dubious proxy.
19. While the dataset aims to calculate the number of unregistered persons in each country, the only empirical data available concerns adult registrations.¹³
20. Data on adult registrations comes primarily from electoral registers or election results. At a glance the numbers derived from electoral systems appear to be suspiciously high, with a number of countries recording over 100% voter turnout. Furthermore voting is restricted to citizens.
21. Only 8 countries, according to the database, derive registration statistics from their national ID database: Côte d'Ivoire, Kenya, Lesotho, Mali, Namibia, Nigeria, Sierra Leone and Uganda.

¹⁰ <https://id4d.worldbank.org/>

¹¹ <https://datacatalog.worldbank.org/dataset/identification-development-global-dataset>

¹² All the figures in this paragraph are drawn from the 2018 Global Dataset. https://development-data-hub-s3-public.s3.amazonaws.com/ddhfiles/94586/wb_id4d_dataset_2018_0.xlsx

¹³ The dataset records the legal age for both registration and voting and uses these to establish a 'cut off' age above which the population should be registered. In most countries this is either 16 or 18. This paper uses 'adult' as a simplification of this cut off age.

IV. A new approach to monitoring

22. The current monitoring framework is not fit for purpose on a number of counts.
 - a. Data is not *comprehensive or accurate* as it relies primarily on small sample household surveys and electoral registers.
 - b. It is not *timely* as both surveys and elections do not take place with sufficient regularity.
 - c. Furthermore it lacks a sense of national or regional *ownership* and *accountability* as governments and agencies are not directly involved with the frameworks, methodologies and managing entities.
23. With current technology improvements CRVS and ID systems are increasingly being housed in national databases fed by digital data capture. While this journey still has some distance to travel sufficient progress has been made for a new monitoring framework to be built on data aggregated directly from these systems.
24. Once digital systems are functioning the cost of publishing progress on an annual basis is minimal. Annual accountability will also highlight short-term progress and incentivise efforts to improve systems.
25. With statistics being drawn from the primary data source the national registration agencies, supported by the national statistics office, should be empowered to maintain both ownership and accountability of the monitoring process.
26. There is an almost inevitable danger that a new monitoring framework could, in the first years of its implementation, deliver underwhelming results. This is not to be feared. Firstly the existing monitoring mechanisms exist independently of this framework and will continue to collect data. Secondly, the new framework will inevitably improve as the underlying systems grow from strength to strength.

Data sources

27. In a new monitoring framework all performance statistics should be sourced wherever possible from cleaned, aggregated counts of records stored within the national CRVS and ID registries, or from considered, documented estimates produced by senior officials within the registration agencies.
28. Data from household surveys and national household and population censuses should continue to be used for quality assurance and sense checking of the new data sources.

Frequency of reporting

29. As more and more countries adopt national databases to manage their registries the aggregation of performance indicators becomes an automated process making timely, annual reporting a feasible option.

30. Annual reporting will not only shine a light on progress within a timescale that is meaningful to policy makers, but over time it will ensure that exaggerated and inaccurate reporting is either ironed out or made transparent to those seeking to hold the registration agencies to account.

Governance

31. *National registration agencies* should be responsible, at the highest level, for the timely and accurate validation and production of the required statistics.
32. *National statistics offices* should be responsible for coordinating, collating and reviewing the data received from its partner agencies. It is the NSOs that will guarantee the sustainability of this initiative through their membership of the UN Statistical Commission and their guardianship of the Strategy for the Harmonization of Statistics in Africa (SHaSA).¹⁴
33. The *UNECA's African Centre for Statistics* (ACS) - on behalf of APAI-CRVS and the Pan-African institutions, should be responsible for collating annual statistics received from its constituent NSOs, for publishing the results and ensuring that they are also submitted to the relevant global monitoring frameworks.
34. The ACS should also be responsible, on behalf of APAI-CRVS, for coordinating efforts for AU members to agree on the content for the establishment and maintenance of a monitoring framework.

¹⁴ <https://au.int/ea/statistics/shasa>

V. Proposed monitoring framework

35. The proposed framework consists of two sections:
 - a. A simple overview of systems development
 - b. Indicators tracking the progress of each system
36. A simple country scorecard summarising the proposal can be found in Appendix 2.
37. Proposed indicator methodologies can be found in Appendix 3.

Systems development

38. Simple 'Yes', 'No' or 'Planned' responses are requested for the following questions:
 - a. Is there an operational CRVS system?
 - b. Is there a digital national registry of births?
 - c. Is digital data captured at the point of birth registration?
 - d. Is there a national ID management system?
 - e. Is digital data captured at point of ID registration?
 - f. Is an ID number issued at the same time as birth registration?

Performance indicators

39. Tracking the progress of the development of systems are 9 performance indicators all expressed as percentages:
 - a. Percentage of population with births registered
 - b. Percentage of births registered in last year
 - c. Percentage of population with births digitally registered
 - d. Percentage of births digitally registered last year
 - e. Percentage of birth registrars using digital data capture
 - f. Percentage of population with ID numbers
 - g. Percentage of population issued ID numbers in last year
 - h. Percentage of ID registrars using digital data capture
 - i. Percentage of newborns in last year with digital birth certificate and ID number

Death Registration

40. The registration of deaths has been excluded from this proposal, not because it isn't a critical issue, but for reasons of sequencing.
41. More than half of the countries in Africa (55%) do not register deaths in a systematic way.¹⁵ Accurately classified data on the causes of death is even weaker.
42. While most countries are capable of making short-term progress with digital birth and ID registration, similar progress on death is a far bigger channel. A new monitoring framework is more likely to be a success if it contains targets that are demonstrably achievable.

¹⁵ See UNSD data in Appendix 1.

VI. Recommendations

43. This paper proposes that the following recommendations be put to the *Fifth Conference of African Ministers Responsible for Civil Registration*.
44. A new system for measuring the progress of civil registration and legal identity should be established based on data derived directly from CRVS and identity registers.
45. National registries should take responsibility for producing annual statistics based either on a count of records within their registries or on the considered opinion of senior analysts with the registration agencies.
46. National statistical offices should take responsibility for collating and curating statistics from their national registries, and reporting these, on an annual basis, to a continental monitoring framework.
47. UNECA, on behalf of the Pan-African Institutions and APAI-CRVS, should take responsibility for drafting and proposing both the content and the governance of a new monitoring framework.

²⁰ Sources referred to as UNSD() are explained in the footnotes to the UNSD table - https://unstats.un.org/unsd/demographic-social/crvs/documents/Website_final_coverage.xls

²¹ The percentage of the adult population that is “registered”. In most instances this refers to voter registration.

²² The number registered above the “cut-off age” which is the voter ID age if the source is voter registration or national ID age if the source is direct administrative ID data. In most countries this is 18. The term “Adult” is used to simplify the table.

²³ Ibid. WB sources this data from UN World Population Prospects 2018. <https://population.un.org/wpp/>

²⁴ “Voter” refers to data accessed from Electoral Registers or Election Results. “Direct” refers to data accessed from national ID systems.

Appendix 2: Proposed country scorecard

Country:		Year:
Is there an operational CRVS system? [YES / NO / PLANNED]	Percentage of population with births registered	
	Percentage of births registered in last year	
Is there a digital national registry of births? [YES / NO / PLANNED]	Percentage of population with births digitally registered	
	Percentage of births digitally registered last year	
Is digital data captured at the point of birth registration? [YES / NO / PLANNED]	Percentage of birth registrars using digital data capture	
Is there a national ID system? [YES / NO / PLANNED]	Percentage of population with ID numbers	
	Percentage of population issued ID numbers in last year	
Is digital data captured at point of ID registration? [YES / NO / PLANNED]	Percentage of ID registrars using digital data capture	
Is an ID number issued at the same time as birth registration? [YES / NO / PLANNED]	Percentage of newborns in last year with digital birth certificate and ID number	

Appendix 3: Proposed indicator methodologies

No.	Indicator	Numerator	Source	Denominator	Source
1	Percentage of population with births registered	<p>a) If all births are digitally registered this will be the same as Indicator 3</p> <p>b) Otherwise this is a formal estimate provided by a senior official of the total number of analogue and digital records, irrespective of age.</p>	National civil registration agency	Total population	Census or intercensal projection
2	Percentage of births registered in last year	<p>a) If all births are digitally registered this will be the same as Indicator 4</p> <p>b) Otherwise this is a formal estimate provided by a senior official of the total number of analogue and digital records added for new-borns in the last calendar year.</p>	National civil registration agency	Total population	Census or intercensal projection
3	Percentage of population with births digitally registered	The total number of birth registration records in the live civil registry less, if necessary, an estimate of deaths not yet accounted for.	National CRVS database	Total population	Census or intercensal projection
4	Percentage of births digitally registered last year	The number of new-born live birth registration records added to the civil registry in the last calendar year.	National CRVS database	Estimate of the number of live births in the last calendar year	Census or intercensal projection

No.	Indicator	Numerator	Source	Denominator	Source
5	Percentage of birth registrars using digital data capture	<ul style="list-style-type: none"> a) If known, the actual number of birth registrars submitting data to the national database using digital data capture devices. b) Otherwise the number of administrative sub-divisions whose registrars have been equipped with digital data capture equipment. 	National civil registration agency	<ul style="list-style-type: none"> a) The total number of birth registrars b) The total number of administrative sub-divisions as used in the numerator 	National civil registration agency
6	Percentage of population with ID numbers	The total number of live records in the national ID management system less an estimate of deaths not yet accounted for	National ID management agency	Total population	Census or intercensal projection
7	Percentage of population issued ID numbers in last year	The number of records added to the national ID management system in the last calendar year, by age.	National ID database	Total population, by age.	Census or intercensal projection
8	Percentage of ID registrars using digital data capture	<ul style="list-style-type: none"> a) If known, the actual number of ID registrars submitting data to the national database using digital data capture devices. b) Otherwise the number of administrative sub-divisions whose ID registrars have been equipped with digital data capture equipment. 	National ID management agency	<ul style="list-style-type: none"> a) The total number of ID registrars b) The total number of administrative sub-divisions as used in the numerator 	National ID management agency
9	Percentage of newborns in last year issued with digital birth certificate and ID number	The intersection of Indicators 4 and 7	National Statistics Office	Estimate of the number of live births in the last calendar year	Census or intercensal projection

Development Initiatives (DI) is an independent international development organisation working on the use of data to drive poverty eradication and sustainable development. Our vision is a world without poverty that invests in human security and where everyone shares the benefits of opportunity and growth.

We work to ensure that decisions about the allocation of finance and resources result in an end to poverty, increase the resilience of the world's most vulnerable people, and ensure no one is left behind.
